

# CISC 4090 Theory of Computation

## Decidability

Professor Daniel Leeds  
dleeds@fordham.edu  
JMH 332

## “Turing recognizable” vs. “Decidable”

Language is **Turing recognizable** if some Turing machine recognizes it

- Also called “recursively enumerable”

Machine that halts on all inputs is a **decider**. A decider that recognizes language L is said to **decide** language L

Language is **Turing decidable**, or just **decidable**, if some Turing machine decides it

2

Not all problems can be solved

- Good to know when you might not find an answer
- Get perspective on limits of computation

3

Decidable problems for regular languages

- Does DFA D accept string s?
- Is  $L(D)$  of DFA empty?
- Are two DFAs D1 and D2 equivalent?

Specify DFA on input TM,  
determine control algorithm to run DFA specified on tape

4

## Arbitrary DFA D accepts string w

Language:  $A_{DFA} = \{(D,w) \mid D \text{ is DFA that accepts } w\}$

Theorem:  $A_{DFA}$  is decidable

~StartQ#AcceptQ# $\delta$ #CurrentState#w~

Proof idea:

- Define machine M that simulates D on w
- If simulation ends in an accept, accept; else, reject

Note: control states in M cannot be states in D  
M needs to run arbitrary D

5

## $A_{DFA}$ decider Proof Outline

DFA D described as string: 5-tuple

Use marks on tape to track

- current state in simulated D
- current symbol read from w

Implement transition function of D for current D state and input w

- D's transition  $\delta$  is **different** from TM M's transition  $\delta$

6

## Arbitrary DFA D accepts **no** strings

$E_{DFA} = \{ D \mid D \text{ is DFA with } L(D) = \emptyset \}$  is decidable language

Proof idea:

- Is there any way to reach accept from start?
- Think of graph-marking

Proof

- Mark start state of DFA D
- Repeat until no new states
  - Mark any state that past-marked states transition to
- If an accept state is marked, REJECT; else, accept

7

## Two DFAs are equivalent

$EQ_{DFA} = \{(A,B) \mid A \text{ and } B \text{ are DFAs and } L(A) = L(B)\}$  is decidable language

Proof idea:

- Construct new DFA C from A and B; C accepts only strings accepted by either A or B, but not both
- Check if C's language is empty (last slide)

8

## $A_{CFG}$ is decidable – Proof

For CFG  $G$  and string  $w$ , determine if  $G$  generates  $w$

Idea 1: Simulate  $G$  to go through all derivations

- May never terminate

Idea 2: Note  $|w|=n$ ;  $2n-1$  steps from CNF rules to each string  
Produce all words of lengths  $n$

- Breadth-first search of finite depth is fixed

9

## $B_{CFG}$ is a decidable language

- For CFG  $G$ , determine if there is any terminal string generated by  $G$
- Mark all variables that generate terminals
- Repeated loop:
- Mark all variables that have previously-marked variables on its rules right sides
- If mark  $S$ , ACCEPT; otherwise reject

$S \rightarrow AB$

$A \rightarrow An \mid x$

$B \rightarrow yB \mid d$

10

## $EQ_{CFG}$ is not a decidable language

- Regular expressions closed under complement and intersection
- CFLs not closed under complement and intersection
- We will prove non-decidable languages later

11

## The Halting Problem

### Key theorem to theory of computation

Addressing unsolvable problems

Unsolvable: Software verification

- For arbitrary computer program  $P$  and precise specification of program's behavior  $S$ , determine if  $P$  fulfills  $S$

12

## Halting Problem specified

$A_{TM} = \{(M,w) \mid M \text{ is a TM and } M \text{ accepts } w\}$

- If  $M$  loops forever on  $w$ , our TM for  $A_{TM}$  must reject  $w$
- This problem is Turing recognizable, but not decidable!

13

## Detour: Cantor diagonalization

Comparing sizes of two infinite sets

- What is larger: set of even positive integers or set of all strings in  $(0U1)^*$

Diagonalization: two sets have same size if each element of set  $A$  can be compared with one element of set  $B$

From CISC 1400: Can you define bijection from set  $A$  to set  $B$ ?

14

## Example pairing

$N = \{1,2,3,4,\dots\}$  and  $E = \{2,4,6,8,\dots\}$

- $N$  and  $E$  have "same size" because there exists bijection from  $N$  to  $E$
- $f(x) = 2x$

Set is **countable** if either it is finite or if it has same size as  $N$

15

## $Q$ is countable

Let  $Q = \{m/n : m, n \in N\}$ , positive rational numbers

Follow diagonal, skipping redundant values

1/1	1/2	1/3	1/4	1/5	1/6
2/1	2/2	2/3	2/4	2/5	2/6
3/1	3/2	3/3	3/4	3/5	3/6
4/1	4/2	4/3	4/4	4/5	4/6
5/1	5/2	5/3	5/4	5/5	5/6
6/1	6/2	6/3	6/4	6/5	6/6

Concatenating infinite set of finite lists produces countable list

Take countable steps along diagonal line to reach each number in  $Q$

16

## Real numbers are uncountable

Real numbers have infinite number of decimal places

Proving uncountability

- Presume we have a list of  $n$  real numbers
- Generate new real number  $x$  **not** in current list
  - Pick  $i^{\text{th}}$  decimal value of  $x$  to be different from  $i^{\text{th}}$  decimal value of element  $i$  in list of real numbers
- At end,  $x$  will not be in list

R(1)	1. <u>5</u> 32532
R(2)	0.3 <u>5</u> 2144
R(3)	5.24 <u>4</u> 525
R(4)	9.327 <u>4</u> 31
R(5)	5.366 <u>3</u> 24
R(6)	4.459 <u>3</u> 22
⋮	⋮
x	3.646311

## Uncountability implications

There are uncountably many languages

There are countably many Turing machines

Some languages are not Turing recognizable

*Are these  
statements true?*

18

“There are countably many Turing machines”

Each TM is captured by finite string  $\langle M \rangle \in \Sigma^*$

- $\Sigma^*$  is countable – add number of strings of length 0, length 1, length 2, ... (like  $\mathbb{Q}$ )

“There are uncountably many languages”

Represent  $L$  as binary sequence

- 1 for each accepted string, 0 for each reject string
- Infinite number of strings – infinite sequence of 0/1s
- Set of possible binary sequences is uncountable (like  $\mathbb{R}$ )

19

“Some languages are not Turing decidable”

Set of TMs is countable

Set of Languages is uncountable

Each TM has one language

Some languages not recognized by any TM

20

## Back to the Halting Problem

$A_{TM} = \{ \langle M, w \rangle \mid M \text{ is a TM and accepts } w \}$

- Proof by diagonalization
- Proof by contradiction

21

## Diagonalization

	$\langle M1 \rangle$	$\langle M2 \rangle$	$\langle M3 \rangle$	$\langle M4 \rangle$	...	$\langle D \rangle$
M1	<u>Acc</u>	Rej	Rej	Acc	...	Acc
M2	Rej	<u>Rej</u>	Acc	Rej	...	Rej
M3	Acc	Rej	<u>Acc</u>	Acc	...	Acc
M4	Rej	Acc	Rej	<u>Acc</u>	...	Rej
⋮	⋮	⋮	⋮	⋮		
D	Rej	Acc	Rej	Rej	...	

22

## Contradiction

Assume  $A_{TM}$  is decidable

H decides  $A_{TM}$

- Input  $\langle M, w \rangle$  causes H to accept if M accepts w, otherwise H rejects

Define a TM D that calls H on  $\langle M, \langle M \rangle \rangle$ , then outputs opposite answer to H

- D rejects if M accepts  $\langle M \rangle$ ; D accepts if M does not accept  $\langle M \rangle$

Run D on itself

- $D(\langle D \rangle) = \text{accept if D does not accept } \langle D \rangle$ ; reject if D accepts  $\langle D \rangle$

Contradiction!

23

## Implications

$A_{TM} = \{ \langle M, w \rangle \mid M \text{ is a TM and } M \text{ accepts } w \}$  is **not** decidable

**Some** algorithms are decidable

$A_{TM}$  is Turing recognizable – just similar M on machine

24

## Co-Turing Recognizable

Language is co-Turing recognizable if it is the complement of a Turing-recognizable language

Theorem: Language is decidable if it is Turing-recognizable and co-Turing recognizable

Thus, for any undecidable language  $L$ , either  $L$  or  $L'$  is not Turing-recognizable

- Is  $A_{TM}'$  Turing-recognizable?

25

## Reducibility

If  $A$  reduces to  $B$ , solution to  $B$  will solve  $A$

Example:  $A$ : Navigate NYC    $B$ : Reading a map

If  $A$  reduces to  $B$

- $A$  is no harder than  $B$
- $A$  could be easier than  $B$

26

## Reduction and decidability

If  $A$  is reducible to  $B$  and  $B$  is decidable

- $A$  is decidable

If  $A$  is reducible to  $B$  and  $A$  is undecidable

- $B$  must be undecidable

27

## $HALT_{TM}$ is undecidable

We can reduce  $A_{TM}$  (TM **accepts**  $w$ ) to  $HALT_{TM}$  (TM **halts** on  $w$ )

$A_{TM}$  is undecidable, this  $HALT_{TM}$  is undecidable

Proof by contradiction:

- Assume  $HALT_{TM}$  is decidable – TM  $R$
- Use  $R$  to construct TM  $S$  to decide  $A_{TM}$
- $S$  definition:
  - If  $R$  does not halt for  $\langle M, w \rangle$ , reject  $w$
  - If  $R$  **does** halt, simulate  $M$  on  $w$

28
