

## CISC 1600/1610 Computer Science I

### Classes

Professor Daniel Leeds  
dleeds@fordham.edu  
JMH 328A

## Data types

Single pieces of information

- one integer – `int`
- one symbol – `char`
- one truth value – `bool`

Multiple pieces of information

- group of symbols – `string`
- group of anything – **`array`**
- group of multiple things – `struct`, **`class`**

2

## Introducing: classes

- A **class** defines a new data type
- Each instance of a class is an **object**
- Each object can contain
  - Actions to perform (functions)
  - Information about the object (variables)

3

## Class dog

Example information

- Size
- Weight
- Location

Example actions

- Eat
- Walk
- Bark

4

## Class syntax – declaration

```
class Dog
{
public:
    void Bark();
    void Eat(float foodQuantity);
    void Walk(float distance);
    float size, weight, location;
};
```

5

## Class syntax – function definitions

```
void Dog::Bark()
{
    cout << "Woof woof!\n";
}

void Dog::Eat(float foodQuantity)
{
    weight+=foodQuantity/2;
    size+=foodQuantity/10;
}
```

6

## Class syntax – create and use an object

```
int main()
{
    Dog fido;
    fido.weight=40.5;
    fido.size=10;
    fido.Eat(20);
    cout << fido.weight << " "
         << fido.size << endl;
    return 0;
}
```

7

## Typical program layout

```
class Dog {
    . . .
};
                                     Declaration

int main() {
    Dog fluffy;
    fluffy.Bark();
    . . .
}
                                     Usage

void Dog::Bark() {
    . . .
}
                                     Definitions
```

8

## Class syntax – declaration

```
class Dog
{
public:
    float size, weight, location;
    void Bark();
    void Eat(float foodQuantity);
    void Walk(float distance);
};
```

**Member variables**

**Member functions**

9

## The Dot Operator .

- Used for functions and data of individual objects
- `fido.Bark()`

## The Scope Resolution Operator ::

- Used for functions of a class
- `Dog::Bark()`

*Note: a function inside a class is called a "member function"*

10

## Multiple instances of a class

```
int main()
{
    Dog fido, spot;
    fido.weight=40.5; fido.size=10;
    spot.weight=30; spot.size=7.5;
    fido.Eat(20); fido.Eat(2);
    cout << fido.weight << " "
         << spot.weight << endl;
    return 0;
}
```

11

## Time to walk the dog...

```
int main()
{
    Dog rufus;
    rufus.weight=35; rufus.size=7.2;
    rufus.location=5;
    rufus.Walk(3.4);
    cout << "New location for Rufus: "
         << rufus.location << endl;
    // Will output location 8.4
    return 0;
}
```

12

## Class syntax – create and use an object

```
int main()
{
    Dog fido;
    fido.weight=40.5;
    fido.Bark();
    ?? // Set fido's location to 3
    cout << ??; // output location
    ?? // Have fido change location
    return 0;
}
```

14

## public vs. private

- public: any function can see and use
- private: only visible to member functions
- Good style:
  - make all member variables private
  - use public functions to access and mutate variables

15

## Class declaration, take 2

```
class Cat
{
public:
    void set(float inWeight, float inSize,
            float inLoc);
    float getSize();
    float getWeight();
    float getLocation();
    . . .
    void Walk(float distance);
private:
    float size, weight, location;
};
```

16

## Function definitions – take 2

```
void Cat::set(float inWeight,
             float inSize,
             float inLoc)
{
    weight=inWeight;
    size=inSize;
    location=inLoc;
}
```

17

## Class usage – take 2

```
int main()
{
    Cat felinel;
    felinel.set(5.5,20.1,2);
    cout << felinel.location; // Error
    cout << felinel.getLocation()
        << endl;
    return 0;
}
```

18

## Bank account

### Variables

- Name
- Current balance
- History of cash in (and out)

### Functions

- Deposit:
  - Add entry to history
  - Update balance

19

```
class Account {
public:
    void open(string inName);
    void deposit(float money);
    float getBalance();

private:
    string name;
    float balance;
};
```

22

```
void Account::open(string inName){
    name=inName;
    balance=0;
}

void Account::deposit(float money) {
    if(money>=0) {
        balance = balance+money;
    }
    else {
        cout << "Error! "
        << "Negative deposit!\n";
    }
}
```

23

### What does this do?

```
int main()
{
    Account accl;
    accl.open("Tina");
    cout << accl.getBalance() << endl;
    accl.deposit(250);
    accl.deposit(20.25);
    cout << accl.getBalance() << endl;
}
```

24

### Withdrawal function?

- How can we write withdraw function to reduce the money in our account?
- How can we prevent over-drawing?

25

### Account review

#### Member variables

- name
- balance
- history,  
num\_transactions

#### Member functions

- open
- deposit
- getBalance
- withdraw
- printHistory

#### New accessor function

- string getName()

26
