Perception

Professor Daniel Leeds
dleeds@fordham.edu
JMH 332

Pathways to perception in 3 (or fewer) synaptic steps

- 0 Input through sensory organ/tissue
- 1 Synapse onto neurons in spinal cord/brain stem
- 2 Synapse onto neurons in thalamus
- 3 Synapse onto cortical neurons in "primary ____ cortex"
- 4+ Further cortical processing

Types of percepts
in this lecture:

- Tactile (touch)
- Audition (sound)
- Vision (sight)

Touch/"Tactile"

Touch: Inputs

Mechanoreceptors in skin

- Pacinian corpuscles – vibrations
- Meissner's corpuscles – light touch
- Merkel's discs – pressure and texture
- Ruffini endings – stretch

Thalamus – the “relay” station

Region names largely based on location

VPL for somatosensation

VPL =
Ventral (bottom)
Posterior (back)
Lateral (side) Nucleus

Legend

- Anterior nuclei
- Medial nuclei
- Lateral nuclei
- LP - Lateral posterior nucleus
- LD - Lateral dorsal nucleus
- VA - Ventral anterior nucleus
- VL - Ventral lateral nucleus
- VP - Ventral posterior nucleus
- VI - Ventral intermediate nucleus
- VPM - Ventral posteromedial
- VPL - Ventral posterolateral

Hearing/“Auditory”

Cochlea

Cochlear nerve → Cochlear nucleus (-> Superior olive) -> Inferior colliculus

Brain stem → **Thalamus** (Medial geniculate nucleus (MGN)) → **Cortex** (Primary auditory cortex (AI))

Geniculate nuclei at most posterior ventral spots in thalamus

Recall: in cochlea have tonotopy
 Neurons selective for specific frequencies

Hearing and frequency decomposition

Sound consists of times and frequencies

Time-bound wavelets:

Similar to cochlear neurons

$$\frac{2}{\sqrt{3}\sigma\pi^{1/4}} \left(1 - \left(\frac{t}{\sigma}\right)^2\right) e^{-\frac{t^2}{2\sigma^2}}$$

“Mexican hat”

Spectrogram

Common patterns in speech

- Vowels (a,e,i,o,u) correspond to steady frequency combinations

Top 2 freqs: i 300, 2500; u 300, 1000; a 500, 1000

- Consonants may be broad-range frequencies, or sweeps

More speech pattern

- Speech **formant** ranges by frequency
- ch, s – long high freq
- d, k, t – broad freq burst
- l, r, n, m – freq slide

The top plot shows the vowel space with axes for First formant frequency, F₁ (Hz) and Second formant frequency, F₂ (Hz). The bottom plot is a spectrogram with a frequency scale from 1k to 10k Hz and a time axis corresponding to the word 'children like straw'.

Spectro-temporal receptive fields

AI (primary auditory cortex) neurons selective for patterns in space and time

Nagel 2008 Neuron Zebra Finch (field L)

The plots show frequency (984, 2674, 7270 Hz) versus time (-40 to 0 msec). The number 11 is at the bottom right.

Binaural hearing

Comparing sounds from left and right

- Time shift and/or Volume Change

The diagram shows sound waves from a speaker reaching a listener's ears. Below are four waveforms labeled 'Left' and 'Right' showing phase and amplitude differences.

Applications:

- Localize sound source
- Distinguish sounds from multiple sources

12

Math of sound localization

Speed of sound c=343 m/s

Human head b=0.2m

The diagram shows a speaker, listener, and sound source with distances d₁, d₂, d, and d_d. It includes a right-angled triangle with hypotenuse 1.7m and angle α. The equation is $\alpha = \sin^{-1} \frac{c\Delta t}{b}$. A neural model shows coincidence detector neurons with axons (delay lines).

If $\Delta t = 5\text{ms}$
 $\Delta d = 343 \times 0.005 = 1.7\text{m}$

1.7 m
 0.2 m
 Jeffres '48
 sound delay/
 axon delay model

$\sin \alpha = \frac{\text{opposite}}{\text{hypotenuse}} = \frac{\Delta d}{b}$

13

Math of sound localization

Speed of sound $c=343$ m/s

Human head $b=0.2$ m

If $\Delta t = 0.5$ ms
 $\Delta d = 343 \times 0.0005 = 0.17$ m

$$\alpha = \sin^{-1} \frac{c\Delta t}{b}$$

$\sin \alpha = \frac{0.17}{0.2} = 0.85$
 $\alpha = \sin^{-1} 0.85 = 58^\circ$

Sound gets R ear @ 1345.2 ms
 to L ear @ 1345.7 ms

$90^\circ = 1.57$ rad ($\frac{\pi}{2}$ rad)
 $\frac{90x}{1.57} \approx \frac{360x}{2\pi}$ degrees

Math of sound localization

Speed of sound $c=343$ m/s

Human head $b=0.2$ m

$$\alpha = \sin^{-1} \frac{c\Delta t}{b}$$

Pick direction for comparison
 $\Delta t = \begin{cases} > 0 & \text{rightSound earlier} \\ < 0 & \text{leftSound earlier} \end{cases}$

Math of sound localization

Speed of sound $c=343$ m/s

Human head $b=0.2$ m

Sound gets R ear @ 258.5 ms
 Get to L ear @ 285.3 ms

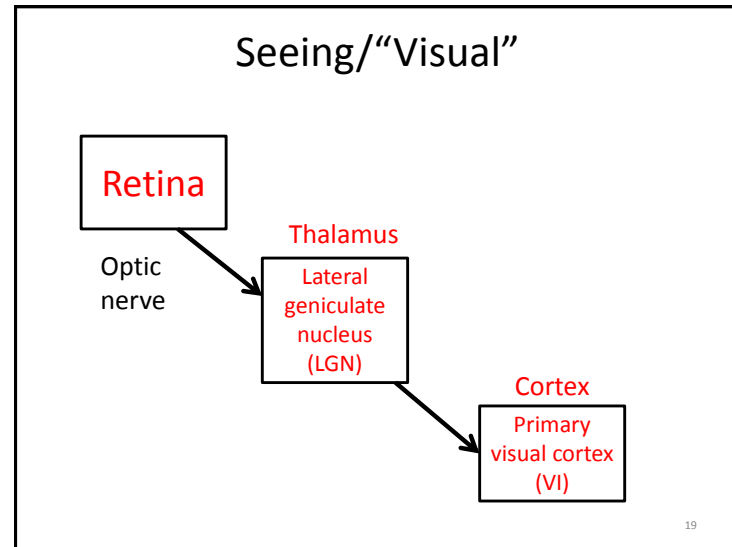

Which ear is sound closest to?
 The ear that sound arrives at first
 Ear with smaller time of arrival

$$\Delta d = c\Delta t = 343 \times (0.2855 - 0.2853)$$

$$\sin \alpha = \frac{\Delta d}{b} = \frac{343 \times 0.0002}{0.2} = 0.35$$

What's my α ?
 Closer to L ear $\alpha = \text{asin}(0.35) = 20^\circ$

$\frac{90x}{1.57} \approx \frac{360x}{2\pi}$ degrees

Sensitivity to perceptual variations

- V1: Surround-suppression for shifted edges

- PFC: Same object detected at diverse locations and scales

21

Selectivity to perceptual variations

- More complex percepts invariant to greater spatial transformations

22

HMAX – model of hierarchical vision

- Higher cortical levels cover larger visual spans
- Object recognition invariant to changes in location and orientation

HMAX – model of hierarchical vision

1. Gabor "filters" (edge detectors) 
2. Perform "Max pooling" (semi-invariance over space)
3. Weighted combination of space-invariant edges
4. Further max pooling

24

Higher HMAX layers cover more space

Example coverage for layer x neurons

layer 1
layer 2
layer 3

25

Functions of HMAX layers

- Odd layers (layer 1, 3, 5, ...) look for specific combinations of lower-level features
- Even layers (layer 2, 4, 6, ...) provide invariance to some feature changes (e.g., shift in position)

layer 1
layer 2
layer 3
layer 4

Fire for 1+ lines
Fire for 1+ Is

26

Functions of HMAX layers

- Odd layers (layer 1, 3, 5, ...) look for specific combinations of lower-level features

$$h = \sum_j w_j r_j^{in} \quad r^{out} = g^{rad}(h)$$

Radial basis function

- Even layers (layer 2, 4, 6, ...) provide invariance to some feature changes (e.g., shift in position)

$$r^{out} = \max([r_1^{in} \quad r_2^{in} \quad \dots \quad r_j^{in}])$$

27

Detecting triangles: layer 2

Neuron outputs 1 if desired image viewed, otherwise 0

Layer 1: Specific edge at specific location

Layer 2: Specific edge at slightly varied locations

max
Layer 2
Horizontal edge at approximate location

max
Layer 2
Diagonal edge at approximate location
