## Systems Neuroscience

### Neuroplasticity: Learning in Neurons

Professor Daniel Leeds  
dleeds@fordham.edu  
JMH 332

1

## Review of weights

$$RI(t) = \sum_k w_k \alpha_k(t)$$

Weights indicate

- Connection (0 or not)
- NT effect
  - $w > 0$  excitatory
  - $w < 0$  inhibitory
- Magnitude of impact of input

2

## Association

We recall information through associations with other information

- Pneumonics:

Roy G. Biv

Please Excuse My Dear Aunt Sally ( ) Exp x / + -

- Memories of experiences:

Lake -> Summer vacation 2014

Dealy -> Final exam Fall 2013

- Complex objects

::Bark:: -> Dog, fur, happy/fear

3

## Features of associators

- Pattern completion/  
generalization

- Fault tolerance
  - Selected dendrites miss input, post-synaptic neuron still fires
- Learning prototypes

- Neuron firing for common combinations

4

**Assume inputs at  $r^{in}=1$  or  $r^{in}=0$**  **Pattern completion** *dog detector*

Activation requires only a subset of desired inputs

$r^{in}$	$w$
leg1	0.5
leg2	0.5
body	0.5
ears	0.5
mouth	0.5
tail	0.5

How many inputs needed to fire?

Define input  $h = \sum_k w_k r_k^{in}$   
 Neuron fires at rate  $r^{out}=1$  when  $h > 1.2$   
 Assume  $r^{in}=1$  when active,  $r^{in}=0$  when inactive

5

**Prototypes** *car detector*

Activation requires all desired inputs

$r^{in}$	$w$
lights	?
wheel	?
trunk	?
door	?
window	?

**$0.3 < w \leq 0.375$**

$h = \sum_k w_k r_k^{in}$   
 Neuron fires at rate  $r^{out}=1$  when  $h > 1.5$

8

$r^{in}$	$w$
a	.3
b	.8
c	.8
d	.1

Best labeled as prototype detector for b and c together

**b and c are the two desired inputs**

$r^{in}$	$w$
a	.7
b	.8
c	.6
d	.7

Best labeled as pattern completion (just need any three of the inputs to fire)

$h = \sum_k w_k r_k^{in}$   
 Neuron fires at rate  $r^{out}=1$  when  $h > 1.5$

9

**Example for pattern completion:**  
 $a=0; b=1; c=1; d=0;$   
 $h=0+0.8+0.6+0 \rightarrow h=1.4$   
 $r^{out}=g(1.4) \rightarrow r^{out}=0$

**Example 2:**  
 $a=1; b=1; c=0; d=1;$   
 $h=0.7+0.8+0+0.7 \rightarrow h=2.2$   
 $r^{out}=g(2.2) \rightarrow r^{out}=1$

$r^{in}$	$w$
a	.7
b	.8
c	.6
d	.7

Best labeled as pattern completion (just need any three of the inputs to fire)

$h = \sum_k w_k r_k^{in}$   
 Neuron fires at rate  $r^{out}=1$  when  $h > 1.5$

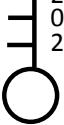

10

## Fault tolerance cow detector

Activation requires only a subset of desired inputs

$r^{in}$     $w$

moo	2
quack	0
woof	0
moo	2
woof	0
moo	2

### How many inputs needed to fire?

In this one case, we assume some of the inputs (e.g., from moo) can fail to communicate over synapse, while other copies of input still work fine. Only need one moo input to work

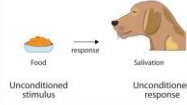

$$h = \sum_k w_k r_k^{in}$$

Neuron fires at rate  $r^{out}=1$  when  $h > 1.5$

12

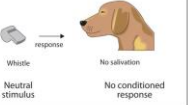

## Learning to associate: Conditioning

1. Before conditioning

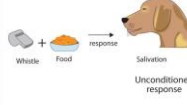

Unconditioned stimulus      Unconditioned response

2. Before conditioning

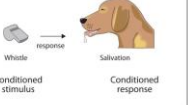

Neutral stimulus      No conditioned response

3. During conditioning

Whistle + Food      Unconditioned response

4. After conditioning

Whistle      Conditioned stimulus      Conditioned response

- Unconditioned stimulus:** smell – already associated with food
- Conditioned stimulus:** whistle – indicates food coming

## Computing level: Associator network

Define input  $h = \sum_k w_k r_k^{in}$   
 Neuron fires at rate  $r^{out}=1$  when  $h > 1.5$

$r^{in}$     $w$

$r^{out} = 1$

**Time X**

At each learning step, add 0.1 to weights of pre-synaptic inputs co-occurring with post-synaptic firing

14

## Two forms of plasticity

- Structural plasticity:** generation of new connections between neurons
- Functional plasticity:** changing strength of connections between neurons

### Hebbian plasticity:

“cells that fire together, wire together”

16

## Chemical level: NT receptors

Increase weight by improving NT detection

Post-synaptic:

- Insert more receptors into dendrite membrane
- Improve performance of receptors

Pre-synaptic:

- Increase amount of NT released

17

## Marr's levels of analysis

- **Computational theory:** Learn associations among sensations
- **Representation and algorithm:** Associate each sense with set of neural outputs, adjust weights on these outputs into another neuron
- **Hardware implementation:** Insert/remove NT receptors from dendrites

18

## Math of Hebbian rate learning

“Cells that fire together, wire together”

$$\Delta w_{ij} = \epsilon(w) r_i r_j$$

$r_i$  ---  $r^{out}$

$r_j$  ---  $r^{in}$

$\epsilon$  learning speed

i.e.:  $\Delta w_{ij} = \epsilon(w) r^{out} r_j^{in}$

19

## Using the learning rule

Define input  $h = \sum_k w_k r_k^{in}$

Neuron fires at rate  $r^{out}=1$  when  $h > 1$

$$\epsilon(w) = \begin{cases} -0.5 & w < 0 \\ 0.5 & w \geq 0 \end{cases}$$

$$\Delta w_{ij} = \epsilon(w) r^{out} r_j^{in}$$

20

## Some more math

$$w_j^{t=2} = w_j^{t=1} + \Delta w_j^{t=1}$$

$$\Delta w_j^{t=1} = \epsilon(w_j^{t=1}) \times r_{out}^{t=1} \times r_1^{t=1}$$

$$\begin{aligned} w_1^{t=2} &= w_1^{t=1} + \Delta w_1^{t=1} \\ &= w_1^{t=1} + \epsilon(w_1^{t=1}) \times r_{out}^{t=1} \times r_1^{t=1} \\ &= 0.5 + \epsilon(0.5) \times 1 \times 1 = 0.5 + 0.5 = 1 \end{aligned}$$

21

## Using the learning rule

Define input  $h = \sum_k w_k r_k^{in}$

Neuron fires at rate  $r^{out}=1$  when  $h > 1$

$$\epsilon(w) = \begin{cases} -0.5 & w < 0 \\ 0.5 & w \geq 0 \end{cases}$$

$$\Delta w_{ij} = \epsilon(w) r_{out}^{out} r_j^{in}$$

22

## Weight control and decay

- Synaptic weights are finite
- Propose learning rules that keep weights bounded

$$\Delta w_{ij} = r_i r_j - c w_{ij}$$

$$\Delta w_j = r_{out} (r_j - w_j) \quad \text{Willshaw}$$

- Or, preserve total synaptic weight across network: **"normalization"**

$$w_j \leftarrow \frac{w_j}{\sum_k |w_k|}$$

23

Side note:

## Weight control with Hebb

$$\Delta w_{ij} = \epsilon(w) r_{out}^{out} r_j^{in}$$

- Higher weight – suppressed weight update

24

### Using weight control and decay

Define input  $h = \sum_k w_k r_k^{in}$   
 Neuron fires at rate  $r^{out}=1$  when  $h > 1$

$$\Delta w_j = r_{out}(r_j - w_j)$$

### Using weight control and decay

Define input  $h = \sum_k w_k r_k^{in}$   
 Neuron fires at rate  $r^{out}=1$  when  $h > .5$

$$\Delta w_{ij} = \epsilon(w) r_i r_j$$

$$\epsilon(w) = \begin{cases} -0.5 & w < 0 \\ 0.5 & w \geq 0 \end{cases}$$

$$w_{ij} \leftarrow \frac{w_{ij}}{\sum_j |w_{ij}|}$$

### Hebb + normalization

Step 1: Compute output at time  $t$

Step 2: Use Hebb learning based on  $r_{out}^t, w_j^t, r_j^t$  to find new  $w_j^{t+1}$ 's

Step 3: Divide new  $w_j^{t+1}$ 's by  $\sum_k |w_k^{t+1}|$  so new  $|w_j|$ 's add to 1

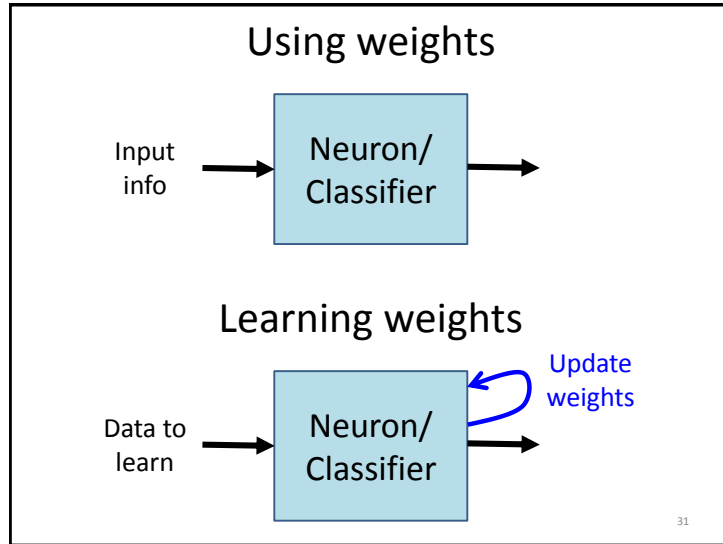

### AI Neural Net Learning

Computed output:  $g^{\text{sigmoid}}(\sum_i w_j r_j^{in})$

Desired output:  $y^{out} \in [0,1]$

$$\bullet \Delta w_j = \epsilon r_j^{in} r^{out} (y^{out} - r^{out})(1 - r^{out})$$

**Biased associations**

- Artificial intelligence (e.g., face recognition) can learn association from training data
- Natural intelligence can learn from life experience

Cultural biases in training data affect artificial intelligence

Wired, Feb 2018
