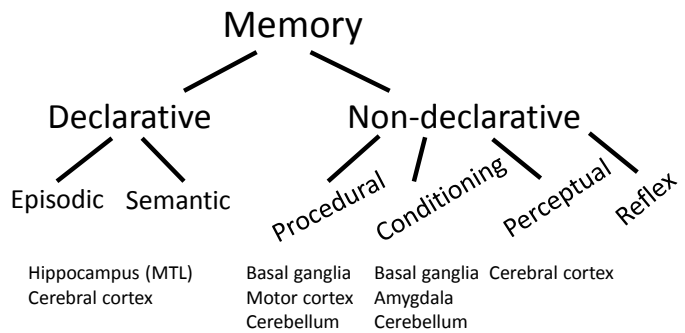
Types of memory



2

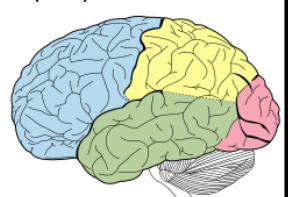
Declarative vs. non-declarative memory

- Declarative
  - "Spring break ended on March 22"
  - "Apples are edible, chairs are not edible"
- Non-declarative
  - Throwing a baseball
  - Pattern completion (seeing the dog behind the fence)

3

Short-term vs. long-term memory

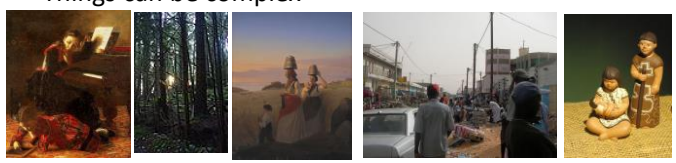
- Short-term memory – aka "working" memory
  - Hold facts in memory for 1-200 seconds
  - Sometimes prolonged version of perception
  - Associated with prefrontal cortex (PFC)
- Long-term memory
  - Stores facts over years
  - Associated with hippocampus (also, amygdala)



4

Modeling limits of working memory

- How much can we hold in working memory?
  - 7±2 things
  - Things can be simple A Q R L G
  - Things can be complex

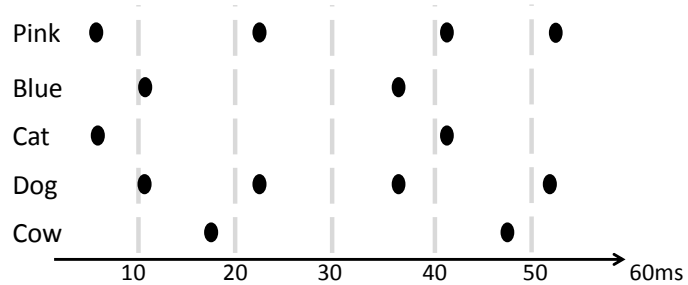


- Why is our working memory limited?
  - Binding hypothesis: distributed code with synchronous spiking – errors with spurious synchronization

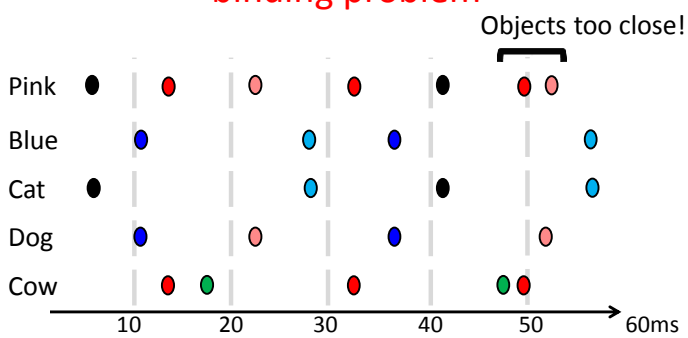
5

Binding hypothesis

Neurons firing at "same time" represent same thing



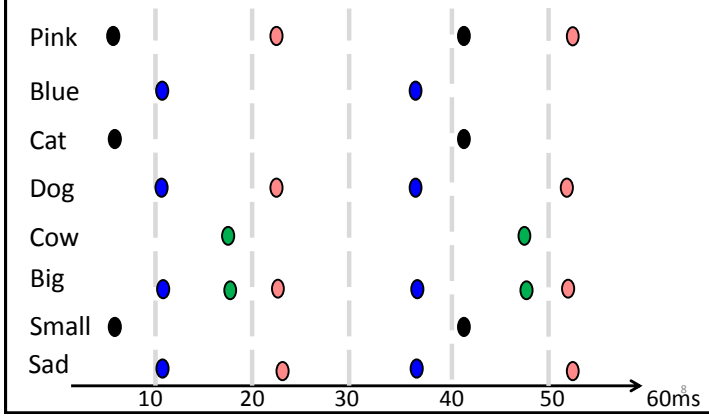
Spurious synchronization – binding problem



If spikes occurring within 1 ms of each other are considered synchronous, hard to incorporate increasing number of spikes in fixed time

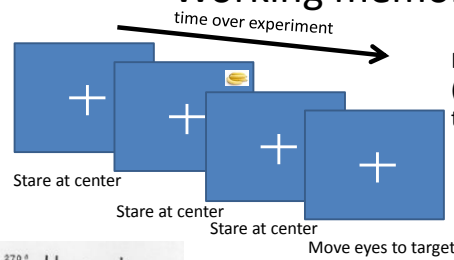
7

More features not increase risk of spurious synchronization

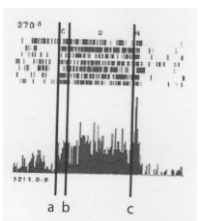


8

Working memory



Delayed "saccade" (move eyes) to target task



Neural memory in dlPFC for delayed-action task
a: stimulus display onset
b: stimulus display offset
c: performance of action

Funahashi et al. 1989

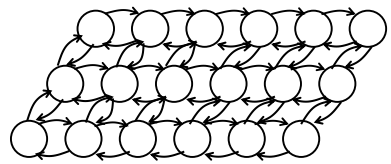
Neural dynamics in "cortical sheet"

- Cortical sheet: group of neurons on same level of hierarchy interacting with lateral connections
- Balance between local cooperation and local inhibition



- r^{out} determined from

h=$\left(\sum_j w_j r_j^{feedfwd}\right) + \left(\sum_k w_k r_k^{lateral}\right) + \left(\sum_m w_m r_m^{feedback}\right)$

Neural system dynamics

Trappenberg 7.3.2

- **Decaying activity:** mutual inhibition suppresses continued neural activity after feedforward input is gone – V1
- **Growing activity:** mutual excitation produces global, non-stop activity over time – epilepsy
- **Memory activity:** balance of mutual excitation and mutual inhibition produces maintained activity ~~(sparse) distributed coding~~ during "working memory" time period – PFC
